

Examples

A genus protonym

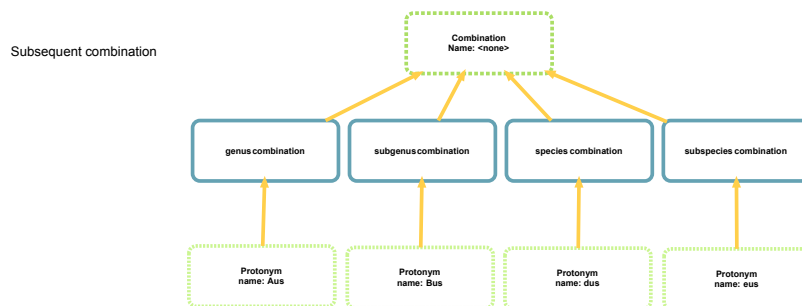

A species protonym

Original combination

Notes

"aus" was originally described as Aus dus aus

Subsequent combination

There exists a combination of 4 protonyms: "Aus (Bus) dus eus"

Synonymy

aus is a synonym of bus, "synonym of" has a URI in NOMEN

Status

aus is invalid (no further reference to why)

Nominotypical Genus

For nomenclatural classification purposes the sub is currently the "Target", and the genus is just some level in the hierarchy. Soft validations fixes handle combination mismatches automatically, unifying the id to that of the lowest (current) protonym in the classification. This has issues, but until we get rid of parent_id, it's consistent.
